

hf-Stem PRP

(Platelet Rich Plasma)

Magic of The Platelets
with A Touch of Technology

give your patients **Magic of The Platelets**

with **A Touch of Technology**

HF-Stem PRP

HF-Stem PRP is a revolutionary method, based on using ingredients of your own blood, which can regenerate your skin. These ingredients reside within the fraction of your blood named "Platelet Rich Plasma" (PRP). PRP is enriched with platelets, stem cells and growth factors. Once injected into your skin, these substances will accelerate the normal healing process via new collagen formation at the injected area. This process brings to long lasting tissue rejuvenation by your own cells. PRP has been widely used for many years in plastic surgery, orthopedics, dentistry, soft tissue implants, and other types of implants

A-Platelet rich plasma is a concentration of human platelets in a small volume of plasma measured as 1,000,000 platelets per mm³ or 2-6 times the native concentration of whole blood.

Advantage of HF stem PRP

hf-Stem PRP is easy and safe product for PRP extraction:

- Matrix Gel Technology
- Simple Operation
- No contamination by pathogens
- CE Certificate
- Cost Effective
- Convenient for office use
- Promotes local tissue growth and repair
- Safe made from the patient's own blood
- Even safe for use under the eyes
- No disease transmission
- No rejection
- Non toxic
- Re-absorbed by the body in just a few days

hf-Stem PRP Injection Technique

Forehead
Intradermal injection 0.05 ml, total for forehead 3 ml.

Upper Eyelid
Subdermal injections 0.2 ml each x3. Total 0.6 ml.

Lower Eyelid
Subdermal 0.2 ml injections 1cm apart, message evenly. Total 1-2 ml.

Cheeks
Subdermal and intradermal injections
Linear threading technique 0.2 ml per injection. Total 3-5 ml per side.

Naso-labial folds
Subdermal and intradermal injections.
Linear threading technique 0.2 ml per injection. Total 2-3 ml per side.

Lips
Vermillion border injections Linear threading techniques 0.2 ml per injections. Total 0.4 ml per quadrant.

Chin
Linear threading technique 0.2 ml per injection. Total 2-3 ml per side.

How To Use

1. Open the package of the butterfly needle
2. Thread the luer-lock adaptor or the Butterfly needle into the tube holder
3. Insert butterfly needle into the vein
4. Push extraction tube into the holder. Tube vacuum system will collect the required volume of blood (approximately 8 ml)
5. Insert filled extraction tube into the centrifuge rotor wells. Enter centrifuge setting as follow:
Time: 9 minutes Speed: 3100 rpm
6. After centrifugation, hold the extraction tube in a vertical position and do not shake.
7. Draw separated Platelet Rich Plasma just above cell separator gel with long needle from application tube.
